Summary

Senior software engineer with 8+ years owning production services end to end, most recently the multi-provider translation LLM engine and agent platform behind WPML, which runs on 1.5M+ WordPress sites, plus the AWS platform it runs on. I take work from design to deployment and own what runs afterwards; when production fails I fix the cause, not the symptom, and harden the path so it stays fixed. Remote-first for the past few years, working across timezones in distributed teams.

Work Experience

OnTheGoSystems (WPML — WordPress plugins)

Remote (Hong Kong)

Senior Software Engineer

Dec. 2024 - Present

- Built the multi-provider translation LLM engine behind WPML (Bedrock, OpenAI, Gemini) with fallback, JSON repair and rate-limit retries.
- Kept plugin APIs backwards compatible across releases and handled deprecation paths and contract tests.
- Own an agentic triage platform handling first-line incident and support inquiries, cutting Mean Time To Resolve.
- Built the guardrails agents run behind: an MCP server exposing live databases, logs and selected APIs through authenticated, monitored access, adopted as the team's standard agent integration path.
- Migrated the product onto ECS Fargate and have owned the platform and its Terraform.
- Owned the GitLab CI pipelines: build, e2e test, SAST, deploy gates for every service in the product.
- Replaced ECS autoscaling with a queue-depth Lambda autoscaler that drains long-running jobs instead of killing them.
- Kept a running backlog of Aurora MySQL's worst queries and cleared it query by query: rewrote plans, added covering indexes and restructured hot reads until CPU pressure stopped turning into incidents.
- Owned credits and billing correctness for a metered LLM product; designed a unified authorization architecture to replace scattered permission checks across services.

Dailymealz

Riyadh, Saudi Arabia

Senior Software Engineer

Dec. 2021 - Dec. 2024

- Built the real-time order service behind a 100,000 daily-user delivery product, on Node.js and Socket.IO, pushing kitchen, driver and delivery status to mobile and web clients.
- Decomposed the fulfillment component of the system out of the PHP/Laravel monolith into a standalone service in an event-driven system, passing state changes over SQS behind a REST API contract.
- Served hot order state from Redis in a write-behind cache pattern with MySQL behind it, keeping status fan-out off the transactional path.
- Chose incremental extraction over a full event-driven rewrite: a team of six couldn't freeze features for months to run two partially consistent systems.
- Led a team of 5 building a driver location check-in system: planning, reviews and pairing across the driver app.
- Migrated the real-time order service from JavaScript to TypeScript so event and message payload mismatches fail at compile time, not at runtime in front of customers.
- Instrumented order, driver and kitchen flows with Datadog and OpenTelemetry, cutting Mean Time To Resolve by 30%.

Nformacy

Cairo, Egypt

Full-Stack Developer

Oct. 2020 - Dec. 2021

- Led features from business requirements to deployment, backend and frontend, and moved the web apps to a SaaS model.
- Built calendar booking for mentors with Zoom, ClickUp and calendar integrations; wrote BDD tests and managed CI/CD pipelines.

DevSquads (formerly Fikr Labs)

Cairo, Egypt

Software Engineer

Jan. 2018 - Oct. 2020

- Built software in self-organizing Extreme Programming teams with TDD, thin vertical slices and test-covered refactoring of legacy code, across React Native, Ruby on Rails, Java Spring and React.
- Mentored teams adopting XP and Agile practices: pairing, code review discipline, iterative planning.

Open Source Projects

ecs-drain-scaler

<https://github.com/Abdelwahab313/ecs-drain-scaler>

2026

- **AWS (ECS, SQS), Terraform, Go** — backlog-driven scaling for queue workers on ECS Fargate plus a drain protocol so scale-in can't kill a task mid-job. Scaling policy implemented with tests; design decisions written up as ADRs. Apache-2.0.

focusflow

<https://github.com/Abdelwahab313/focusflow>

2026

- **TypeScript, PocketBase, GitHub Actions** — offline-first daily planner and focus timer: plan against a backlog, run focus sessions on one task, review planned vs actual time. Optional sync to a self-hosted PocketBase. MIT.

handoff-mcp-server

<https://github.com/Abdelwahab313/handoff-mcp-server>

2026

- **TypeScript, MCP** — MCP server that saves and restores an AI coding agent's task context as a validated briefing between sessions.

egy-finance-radar

<https://github.com/Abdelwahab313/egy-finance-radar>

2026

- **Python, PostgreSQL, Next.js** — EGX research tool: fundamentals classification, technical signals and dated recommendations behind a dashboard.

Education

Faculty of Science Cairo University

Bachelor of Science in Geophysics

Cairo, Egypt

Sep. 2012 - Jun. 2016
